Dear Client,

A massive ransomware called “Petya” has now attacked multiple countries around the world, causing major companies to shut down their computer systems.

Researchers are still investigating the software behind the attack, warning that it's more sophisticated than the WannaCry worm that struck hundreds of thousands of computers across the globe last month. In case of a successful compromise, the user loses all control over the system and all data is lost / encrypted.

We would like to assure our clients and friends, that too date, Enterprise Outsourcing and Secured Enterprise clients have not been affected by the ransomware attack and that we are vigilant with regards to securing our clients' networks. Enterprise Outsourcing and Secured Enterprise have ensured with our strategic security partners, that measures have been put in place in order to secure our clients infrastructure and data.

Unfortunately, no company can be 100% secure, and we would urge our clients to be aware and bring to all users' attention the following:

- Do not pay the ransom because you will not get the decryption key;
- For “Petya” to encrypt the information, it needs to restart the computer. This is done by creating a scheduled task to restart the invective computer. Delete the task, leave the computer and call a security expert;
- If the computer restarts, immediately shut down the computer by pulling out the power cord and call your security expert.

Enterprise Outsourcing and Secured Enterprise, would like to assure you that we are taking all preventative measures to secure our clients data and their networks. Our team is available 24/7 should you have any question or concerns.
